

State Management

AI Tutor - Flutter - Lesson 3

What is State?

State is any data that can change while the app is running and affects what's displayed on screen - like whether a user is logged in, or how many items are in a cart.

The Provider Pattern

Provider is a popular state management approach for Flutter. A `ChangeNotifier` class holds the data and calls `notifyListeners()` whenever it changes; widgets that 'watch' the provider automatically rebuild with the new data.

Why It Matters

Without a state management approach, passing data between distant widgets becomes messy. Provider (and alternatives like Riverpod or Bloc) keep an app's data flow predictable and easy to maintain as it grows.
