

Widgets and Layouts

AI Tutor - Flutter - Lesson 2

Stateless vs Stateful Widgets

- **StatelessWidget** - immutable; its properties can't change once built (e.g. a static label).
- **StatefulWidget** - can rebuild itself when its internal data (state) changes (e.g. a counter).

Common Layout Widgets

- **Column** - arranges children vertically.
- **Row** - arranges children horizontally.
- **Container** - adds padding, margin, decoration around a child.
- **Stack** - overlays children on top of one another.

Building a Simple Layout

A typical screen combines these widgets: a Column holding a Text title, a SizedBox for spacing, and a Row of buttons - each widget nested inside the next to build the full visual tree.
