

Functions and Structs

AI Tutor - Golang - Lesson 2

Functions

Functions in Go are declared with the `func` keyword and can return one or more values:

- `func add(a int, b int) int { return a + b }`

Structs

A struct groups related fields into a single custom type - similar to a class without built-in inheritance:

- `type User struct { Name string; Age int }`

Methods on Structs

Go allows attaching functions (methods) to a struct, giving it behavior:

- `func (u User) Greet() string { return "Hello, " + u.Name }`
